BellaBeat Case Study

Zubair Matani

11/5/2021

Figure 1: bellabeat logo

Introduction

This is a Google Data Analytics Capstone project. The purpose of this project is to learn, understand and apply the concepts we learnt in the Google Analytics Course.

Goals and Business Statement

This case study tasks us with assisting a wearable fitness technology company, BellaBeat, improve their marketing strategies for their products by investigating customer activity with other fitness trackers like FitBit.

We will look at datasets to find the following:

- How customers use fitness trackers in their everyday life?
- What features are most popularly used?
- Which of these features does BellBeat already have, and how can we improve our marketing skills for those?
- What additional features can BellBeat introduce to add more customers?

Data Usage

What Data are We Using?

The data provided to us by BellBeats is https://www.kaggle.com/arashnic/fitbit. This data website ranges from their daily activities, to their steps to their heart rate, calories intake and much more. All of the data is stored in different .csv files which we will be impporting to analyze and support our statements.

Loading CSV Files

The following data sets will be used:

- Daily Activity
- Daily Calories
- Daily Sleep
- Weight Log Info
- Daily intensities

```r
dailyActivity <- read.csv("dailyActivity_merged.csv")
dailyCalories <- read.csv("dailyCalories_merged.csv")
sleepDay <- read.csv("sleepDay_merged.csv")
dailyIntensities <- read.csv("dailyIntensities_merged.csv")
weightLog <- read.csv("weightLogInfo_merged.csv")
```

Exploring the Tables

For each of the tables we have decided to work our analysis with, we will take a closer look at them using the head(), glimpse() and colnames() function. This would allow us to look at the first six values of each table and see each table with it's distributed columns respectively. ### Daily Activities

```r
head(dailyActivity)
```

```

```

Short Summary

Using the glimpse and the column names functions, it is easily noticeable that the ID column is common all 5 data sets in this analysis.

The daily activity table gives us a hint that it contains values for calories and intensities as well which would allow us to extract data only using the ID column.

In order to shorten our summary table we will create a new data frame selecting only ID, ActivityDate and and Calories.

```
dailyActivityNewFrame <- dailyActivity %>%
  select(Id, ActivityDate, Calories)

head(dailyActivityNewFrame)
```

```
##           Id ActivityDate Calories
## 1 1503960366    4/12/2016     1985
## 2 1503960366    4/13/2016     1797
## 3 1503960366    4/14/2016     1776
## 4 1503960366    4/15/2016     1745
## 5 1503960366    4/16/2016     1863
## 6 1503960366    4/17/2016     1728
```

To make sure the new data frame we have just created has the correct number of rows, we will use an SQL query to check the number of rows.

```
sqlCheck <- sqldf('SELECT * FROM dailyActivityNewFrame INTERSECT SELECT * FROM dailyCalories')
head(sqlCheck)
```

```
##           Id ActivityDate Calories
## 1 1503960366    4/12/2016     1985
## 2 1503960366    4/13/2016     1797
## 3 1503960366    4/14/2016     1776
## 4 1503960366    4/15/2016     1745
## 5 1503960366    4/16/2016     1863
## 6 1503960366    4/17/2016     1728
```

```
nrow(sqlCheck)
```

```
## [1] 940
```

The nrow() function shows 940 shows which is the same as we noticed earlier hence our data check is verified and we are good to go ahead. ## Analysis For the analysis stage, we will consider distinct data from the tables which would allow us to analyze data for each ID and not the same repititative ones.

Repitative vs Distinct Rows

```
n_distinct(dailyActivity$Id)
```

```
## [1] 33
```

```
nrow(dailyActivity)
```

```
## [1] 940
```

```
n_distinct(sleepDay$Id)
```

```
## [1] 24
```

```
nrow(sleepDay)
```

```
## [1] 413
```

```
n_distinct(weightLog$Id)
```

```
## [1] 8
```

```
nrow(weightLog)
```

```
## [1] 67
```

Quick Statistics

Daily Activity

```
dailyActivity %>%
  select(TotalSteps, TotalDistance, SedentaryMinutes, VeryActiveMinutes) %>%
  summary()
```

```
##    TotalSteps    TotalDistance    SedentaryMinutes VeryActiveMinutes
##  Min.   :    0   Min.   : 0.000   Min.   :   0.0   Min.   :  0.00
##  1st Qu.: 3790   1st Qu.: 2.620   1st Qu.: 729.8   1st Qu.:  0.00
##  Median : 7406   Median : 5.245   Median :1057.5   Median :  4.00
##  Mean   : 7638   Mean   : 5.490   Mean   : 991.2   Mean   : 21.16
##  3rd Qu.:10727   3rd Qu.: 7.713   3rd Qu.:1229.5   3rd Qu.: 32.00
##  Max.   :36019   Max.   :28.030   Max.   :1440.0   Max.   :210.00
```

Sleep

```
sleepDay %>%
  select(TotalSleepRecords, TotalMinutesAsleep, TotalTimeInBed) %>%
  summary()
```

```
##  TotalSleepRecords TotalMinutesAsleep TotalTimeInBed
##  Min.   :1.000     Min.   : 58.0      Min.   : 61.0
##  1st Qu.:1.000     1st Qu.:361.0      1st Qu.:403.0
##  Median :1.000     Median :433.0      Median :463.0
##  Mean   :1.119     Mean   :419.5      Mean   :458.6
##  3rd Qu.:1.000     3rd Qu.:490.0      3rd Qu.:526.0
##  Max.   :3.000     Max.   :796.0      Max.   :961.0
```

Weight Log

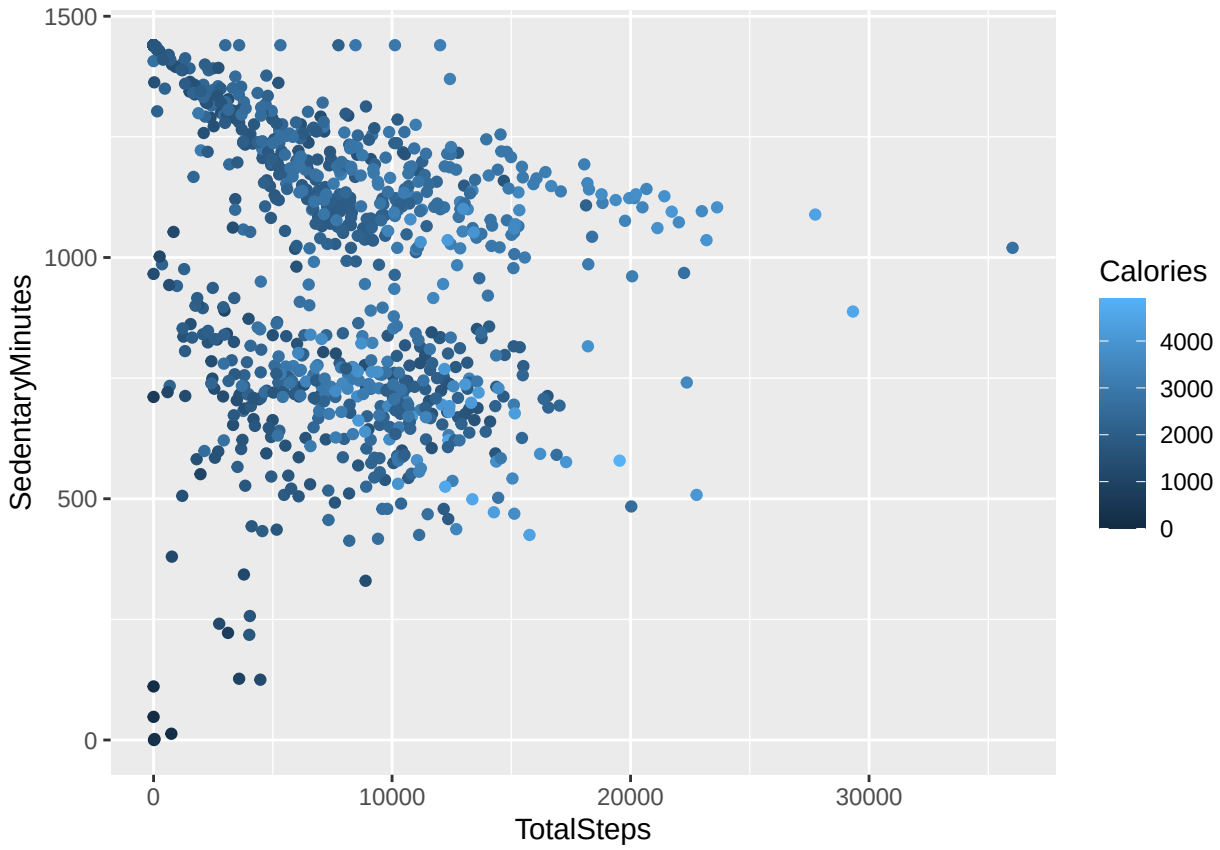
```
weightLog %>%
  select(WeightPounds, BMI) %>%
  summary()
```

```
##   WeightPounds        BMI
##  Min.   :116.0   Min.   :21.45
##  1st Qu.:135.4   1st Qu.:23.96
##  Median :137.8   Median :24.39
##  Mean   :158.8   Mean   :25.19
##  3rd Qu.:187.5   3rd Qu.:25.56
##  Max.   :294.3   Max.   :47.54
```

Analysis: Plot

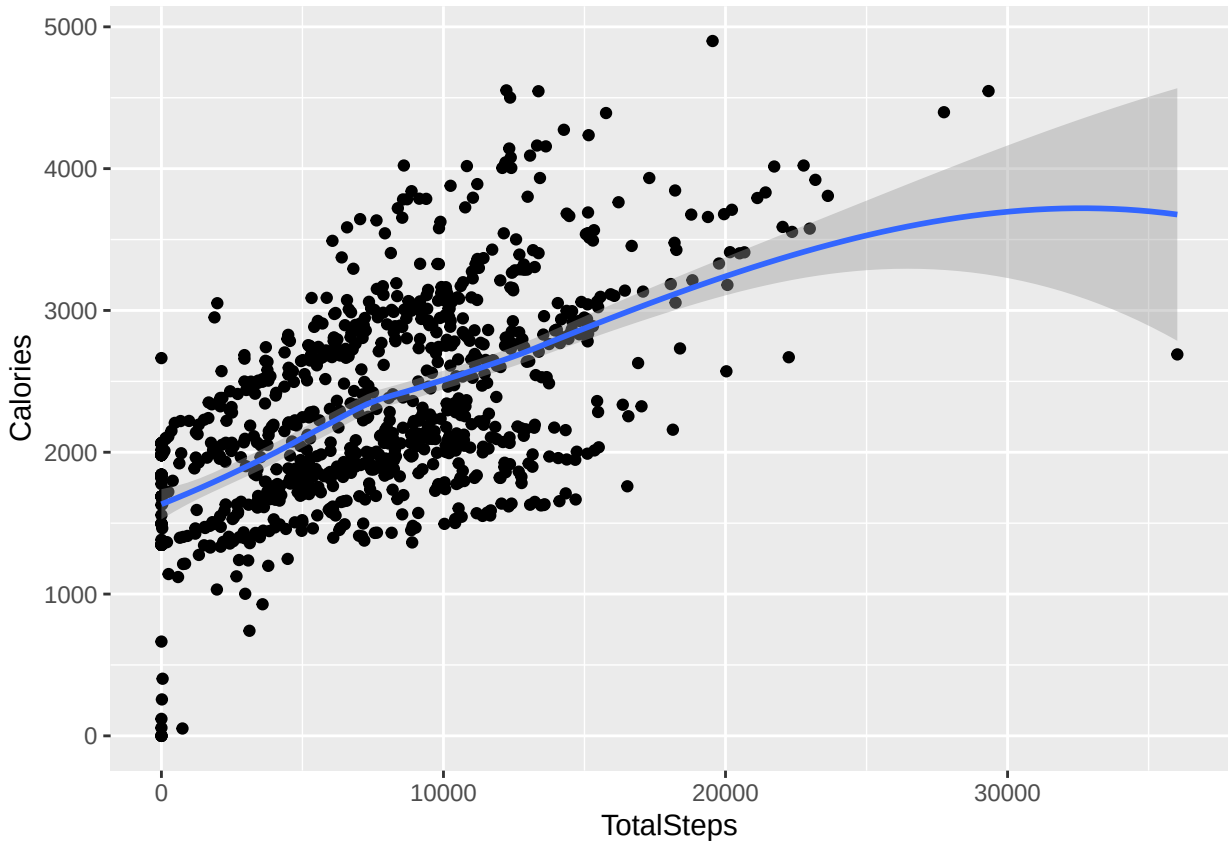
The plot for Total Steps vs Sedentary Minutes is as follows:

```
ggplot(data = dailyActivity, aes(x = TotalSteps, y = SedentaryMinutes, color = Calories)) + geom_point()
```



```
ggplot(data = dailyActivity, aes(x = TotalSteps, y = Calories)) + geom_point() + stat_smooth()
```

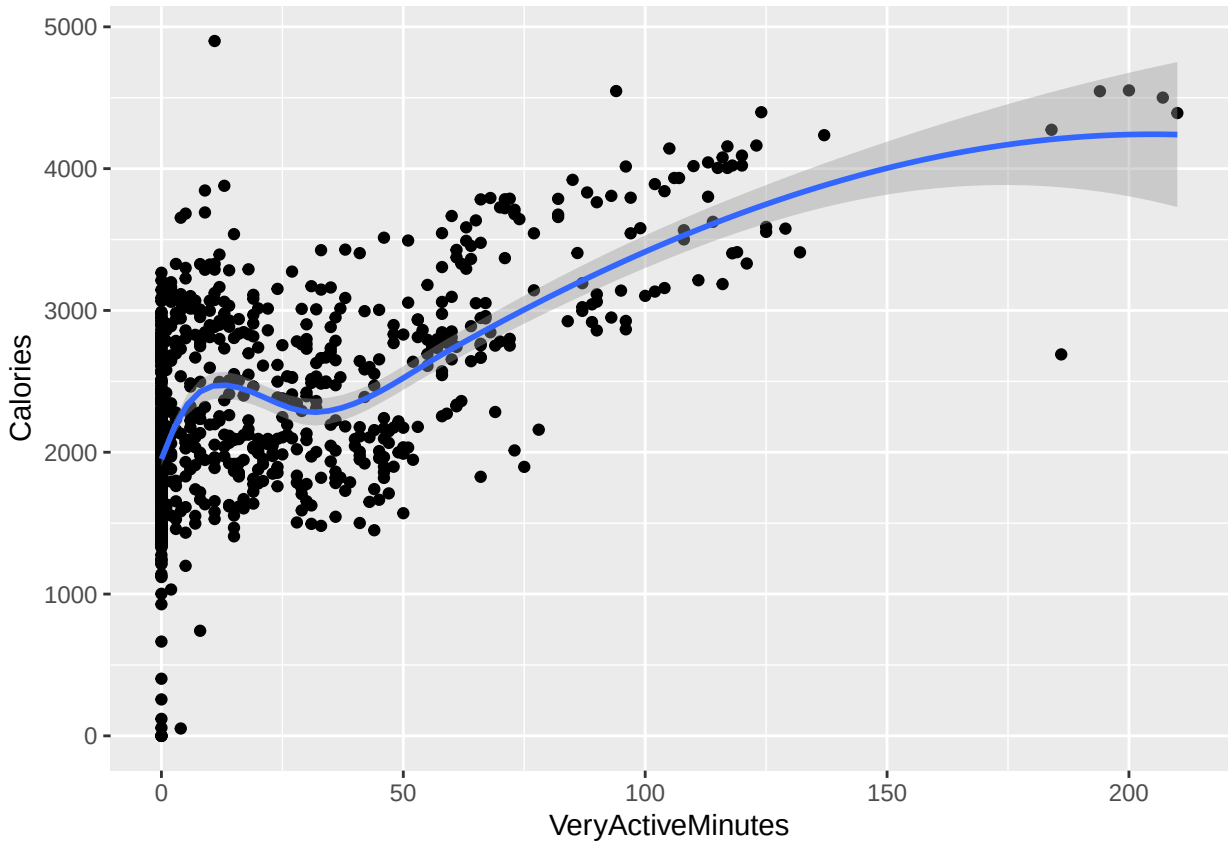
```
## `geom_smooth()` using method = 'loess' and formula 'y ~ x'
```



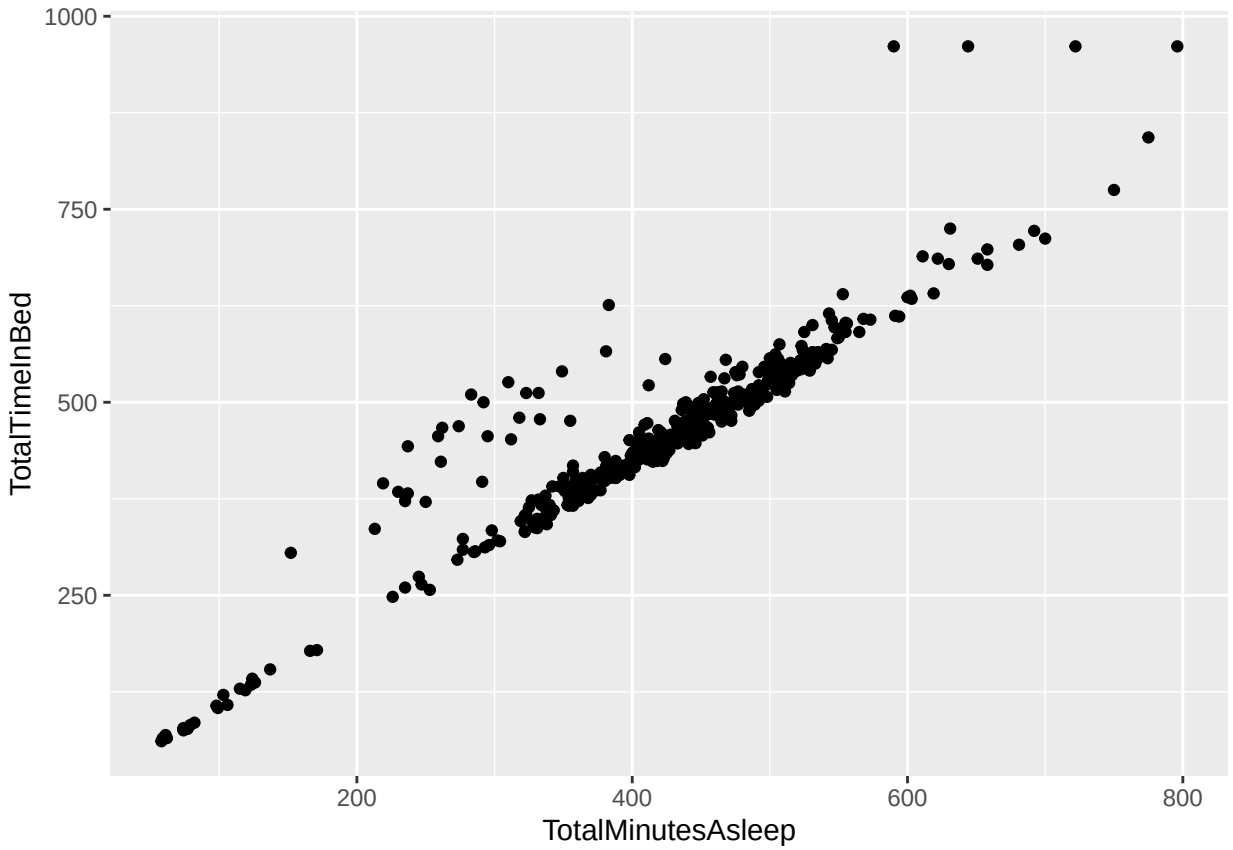
The graph above clearly demonstrates that the relation between the number of steps walked and the amount of calories burned is linear. The more the number of steps, the higher the calories burned.

```
ggplot(data = dailyActivity, aes(x = VeryActiveMinutes, y = Calories)) + geom_point() + stat_smooth()
```

```
## `geom_smooth()` using method = 'loess' and formula 'y ~ x'
```



```
ggplot(data = sleepDay, aes(x=TotalMinutesAsleep, y=TotalTimeInBed)) + geom_point()
```



This plot shows that people have not been logging their sleep hours in the proper manner and therefore this data is not too useful to make use of. ## Conclusion

Some of the things I noticed when analyzing this data:

- Fitbit is not collecting any hydration data, Bellabeat does which makes it more user friendly and something that regular users would enjoy working with.
- People need to log their sleep times properly
- Another feature I would like Bellabeat to add is the different modes of exercise or to create a program that would allow the sensors to monitor and recognize what sort of exercise the user is doing and then log it in the watch rather than entering or starting the watch feature to collect data.
